Cut into strips and give to each team of students, one strip to each student. Have them race to see which team can correctly add up all of the numbers. Before handing out the strips, explain that they might like to divide up the labor somehow so that not everybody is doing the same thing. Stress that accuracy will be important, since it is the first team that finds the correct total (which is 187335) will win. Thus, they may want to have several students doing the same things as error-checks.
